

Resume Preparation Guidelines

Section 1: Resume Structure and Sections

What sections should a fresher resume include?

A fresher resume should include contact details, a short career objective or summary, education, technical skills, projects, internships or experience, certifications, and achievements. Keep it to one page.

What should be in the contact section?

Include your full name, phone number, a professional email address, your city, and links to your LinkedIn and GitHub profiles. Avoid unprofessional email names.

How do I write a good career objective?

Write two or three lines stating your degree, your key skills and the role you are targeting. Keep it specific and avoid generic phrases. Example: Final-year computer science student with skills in Python and machine learning, seeking an entry-level role in AI to apply and grow my technical skills.

How should I list education?

List your degrees in reverse chronological order, with the institution, the course, the year of passing and the percentage or CGPA. Place education above experience if you are a fresher.

How should I list technical skills?

Group skills by category, such as programming languages, frameworks and libraries, databases, and tools. List only the skills you can discuss confidently in an interview.

Section 2: Writing Project Descriptions

How should I describe a project on my resume?

Give the project title and the technologies used, followed by two or three bullet points. Each bullet should start with a strong action verb, describe what you built, and mention the result or impact. Use numbers where possible.

What are some strong action verbs for resume bullets?

Examples are built, developed, designed, implemented, deployed, analysed, optimised, automated and improved.

What points should be included when explaining a final-year project?

Explain the problem the project solves, the technologies and tools used, your own role and contribution, the main features or architecture, the challenges you faced and how you solved them, and the result or outcome. Be ready to explain every technology you list.

How do I describe a project if I have no internship experience?

Focus on academic projects, personal projects, hackathons and online certifications. Describe the problem, your technical approach and the outcome. Strong projects with clear explanation can be as valuable as an internship for a fresher.

Example project bullet points

Built a document question-answering application using Python and LangChain that retrieves answers from PDF files and shows source citations. Developed a data analysis dashboard that reduced manual report preparation time by half. Deployed a web application so that users could access it online.

Section 3: Common Resume Mistakes and Tips

What are common resume mistakes?

Common mistakes include spelling and grammar errors, a resume longer than one page for a fresher, an unprofessional email address, listing skills you cannot explain, vague descriptions without results, inconsistent formatting, and including unnecessary personal details such as a full address or religion.

What internship questions can be asked from my resume?

Interviewers may ask what your responsibilities were, what you learned, what challenges you faced, what technologies you used and what the outcome of your work was. Prepare short real answers for each internship or project listed.

What technical project questions are commonly asked?

Common questions include why you chose a particular technology, how the system works end to end, what difficulties you faced, how you tested it, what you would improve, and how it could scale.

How should I format my resume?

Use a clean, simple layout with consistent fonts and spacing, clear section headings and bullet points. Save and send it as a PDF with a clear file name such as Name_Resume.pdf. Avoid photos, graphics and complex tables, since applicant tracking systems may not read them correctly.

How often should I update my resume?

Update it whenever you complete a project, certification or internship, and tailor it to each job application by highlighting the most relevant skills and projects.
